## Seleroute.jl, a generic package for network-routing optimisation

*jeudi 5 octobre 2023 16:00 (30 minutes)*

Seleroute.jl is an implementation of many state-of-the-art algorithms to compute optimum computer-network routing. These include oblivious routing to take into account the demand uncertainty into the routing or variants of fair routing. The possibilities of Julia have had a decisive impact on design decisions.
